Effective transitions of care (“patient handoffs”) are essential for patient safety and trainee education. Many stroke services do not have a vascular neurology fellow year round, so the direct responsibility for patient care when a fellow transitions on/off service falls to the attending physician. When on the inpatient ward services, fellows will utilize face to face, email and telephone communication daily regarding each patient to ensure effective transitions and continuity of care with the attending physician. In addition, they will use the online resident handoff tool in Compass or another online tool to communicate patient care information to the accepting attending when rotating off of the service. In the outpatient clinic setting, the electronic note created by the fellow and cosigned by the attending serves as the tool for transition of care. These same tools are used in turn by the supervising attending physicians to provide information to the vascular neurology fellows about the patients they will care for when beginning a new inpatient rotation or outpatient clinic day.
